

Answer Key:

1. Nancy was born in Denver where the cosmic rays (GCR) produce 120 milliRem/year and an additional 105 milliRem/year comes from the ground (Terr.). After 30 years, she moves to Baton Rouge, Louisiana where GCR = 35 milliRem/year and Terr. = 40 milliRem/year. At both locations, she buys the same kind of house and she receives 100 milliRem/year from radon gas in the basement. Assuming all other lifestyle sources contribute 50 milliRem/year during her entire life, and that she is now 65 years old, what has been her total radiation dosage to date in Rem?

Denver: $(120 + 105 + 100 + 50)\text{millirem/year} \times 30 \text{ years} \times 1 \text{ Rem}/1000 \text{ milliRems} = 11.25 \text{ Rem}$
Baton Rouge: $(35 + 40 + 100 + 50) \text{ millirem/year} \times (65-30) \text{ years} \times 1 \text{ Rem}/1000 \text{ milliRems} = 7.88 \text{ Rem}$

$$\text{Total} = 11.25 \text{ Rems} + 7.88 \text{ Rems} = 19.1 \text{ Rems.}$$

2. Suppose that Nancy was a cigarette smoker since she was 16 years old, but that she gave up smoking when she turned 52. How much additional lifetime radiation dosage in Rems did she receive from this habit during the time she lived in Denver and Baton Rouge if her one-pack-a-day habit exposed her to 15 milliRem/year?

$$\begin{aligned} \text{Smoking} &= 15 \text{ milliRem/year} \times (52-16) \text{ years} \times 1.0 \text{ Rem} / 1000 \text{ milliRems} = 0.5 \text{ Rem} \\ \text{Geographic} &= 19.1 \text{ Rem} \\ \text{Total} &= 19.1 \text{ Rems} + 0.5 \text{ Rems} = 19.6 \text{ Rems} \end{aligned}$$

3. Suppose that Nancy was also an airline pilot since she was 27 years old, and retired at 45. She has been smoking since age 16. She flies 900 hours each year, with 90% of this time spent at cruising altitudes (35,000 feet) where the cosmic radiation dosage is 5 microSeiverts per hour. If 1 Seivert = 100 Rems, how much additional radiation has she received than in your answer to Question 2?

$$\begin{aligned} 900 \text{ hours/year} \times (45-27) \times 0.90 &= 14,580 \text{ hours.} \\ 5 \text{ microSeiverts/hour} \times 100 \text{ Rems}/1 \text{ Seivert} &= 500 \text{ microRems/hour} \\ 500 \text{ microRems/hour} \times 14,580 \text{ hours} \times 1 \text{ Rem}/1000000 \text{ microRem} &= 7.3 \text{ Rems} \\ \text{Total} &= 19.6 \text{ Rems} + 7.3 \text{ Rems} = 26.9 \text{ Rems} \end{aligned}$$

4. Suppose that after 30 years, instead of moving to Baton Rouge, Nancy moved from Denver to Kerala, India where the terrestrial radiation dosage (Terr.) is 380 milliRem/year, but gives up smoking. What will be her total dosage by age 65?

$$\begin{aligned} \text{Denver} &= 11.3 \text{ Rems} \\ \text{Kerala} &= 380 \text{ milliRems/year} \times (65-30) \text{ years} \times 1.0 \text{ Rem}/1000 \text{ milliRems} = 13.3 \text{ Rems} \\ \text{Total} &= 11.3 \text{ Rems} + 13.3 \text{ Rems} = 24.6 \text{ Rems} \end{aligned}$$

5. Instead of being an airline pilot, at age 35 she decides to become a non-smoking astronaut. After 30 years in Denver, she moves to Baton Rouge for 5 years, then finds a home in Houston. At this location, GCR = 40 milliRem/year and Terr. = 30 milliRem/year. At age 39 she becomes the co-pilot for the Space Shuttle Atlantis on a 13-day trip, during which time her radiation dosage is 19 milliRem/day. If she takes three of these trips before age 65, what is her total dosage?

$$\begin{aligned} \text{Denver:} & 11.3 \text{ Rems} \\ \text{Baton Rouge:} & 225 \text{ millirem/year} \times (35-30) \text{ years} \times 1 \text{ Rem}/1000 \text{ milliRems} = 1.1 \text{ Rem} \\ \text{Houston:} & 220 \text{ millirem/year} \times (65-35) \text{ years} \times 1 \text{ Rem}/1000 \text{ milliRems} = 6.6 \text{ Rem} \\ \text{Shuttle Flights:} & 3 \times 13 \text{ days} \times 19 \text{ milliRem/day} = 0.7 \text{ Rems} \\ \text{Total} &= 11.3 \text{ Rems} + 1.1 \text{ Rems} + 6.6 \text{ Rems} + 0.7 \text{ Rems} = 19.7 \text{ Rems} \end{aligned}$$
